

EAST BAY DRUG CHECKING COLLABORATIVE (EBDC)

Drug Checking Results

August 2026

Drug Samples

We test participant drug samples to give them information about what is in the drugs they purchased and how much it aligns with what they intend to buy. In August 2026, we tested 103 drug samples and received RaDAR results for 93.

Drug Paraphernalia

We check drug paraphernalia to get additional insights into the drug supply. In August 2026, we tested 2 and received results for 1 total paraphernalia.

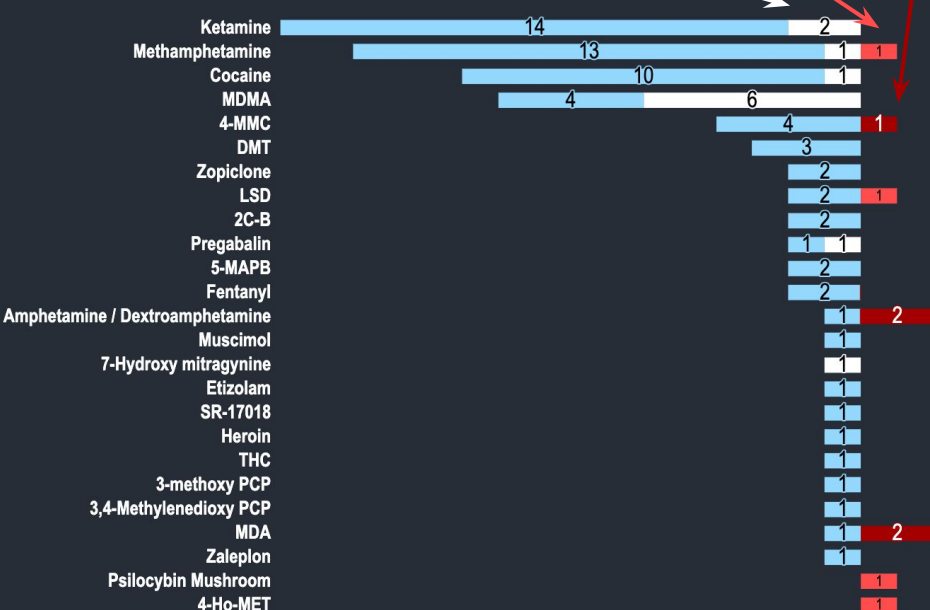

What drug was sold as

Sold drug detected; no other drugs detected

Sold drug mixed with another drug

No drugs detected at all

Only a different drug detected

Notes: 3 samples where the "sold as" drug was unknown were tested: 1 sample had No Compounds Detected and 2 were Ketamine.

Paraphernalia Types with Results

2 pipes

Most Common Drugs Detected

Pipe

Cocaine

1

Key Highlights for August 2026

- EBDC analyzed a sample sold as Methamphetamine using FTIR and detected only aluminum sulfate, a widely available inorganic salt with many household applications. While generally non-toxic at low doses, aluminum sulfate has the potential for tissue irritation.
- Both samples sold as Adderall contained only methamphetamine HCl.
- The six samples sold as MDMA that contained MDMA + another drug also contained Methamphetamine (x1), MDEA (x4), and MDA (x1).
- Three samples were sold as drugs that EBDC has not previously encountered: Zaleplon, Armodafinil, and Muscimol.
